Run the program and enter a file path. The keygen then creates a registry key on the computer. The registry key has two values. The first value is the standard public key. The other value is the private key that will be used for decoding encrypted data. The keygen then saves the private key to a file. Run the program again. The program now has the standard public key and the private key. The standard public key will be used to decode the encrypted data while the private key will be used for authenticating. The keygen next creates the autocad.cfg file which contains the standard public key, the username and the password. The keygen then saves the autocad.cfg file to the default location where it can be opened with Autodesk products. The program can now be started with the autocad.cfg file. The autocad.cfg file now contains the standard public key and the username and the password. The standard public key will be used to decode the encrypted data while the username and the password will be used for authenticating. The program now starts and you can add new files. The standard public key is then saved to a file. This new key will then be used for decoding the encrypted data. After this step you will no longer need the keygen.
