How does a plotter work? The plotter accepts the graphic information (line drawing, plotter language) from the CAD and generates a hard copy (printed) by directly depositing ink on paper or other print medium. The physical size of the printed image can be adjusted by the plotting software. In CAD, the lines are represented by points on a grid, while the geometry of the object is stored in a memory as a series of commands (points, arcs, lines, etc.) that the CAD user enters into the software. The geometric data is read into the CAD memory by the CAD program and the plotting software reads it out to make the graphic. This all happens automatically. What is CAD software? The term CAD software refers to a set of tools used for designing and drawing, as well as analyzing, measuring, and inspecting a design. Although CAD applications may be designed to work with three-dimensional objects, most are used for creating 2D drawings, including graphs, flow charts, schematics, and floor plans. An example of a CAD application is AutoCAD Serial Key, which is used for designing everything from cars to airplanes. It is part of a family of programs offered by Autodesk. Other applications include Inventor, Architecture, Building, and Landscape. CAD software works by "pushing" the design and drawing around the edges of the design drawing window, as shown below. When you push, the design window is moved to new pages within the file and the drawing lines are deleted. Each movement is called a "push". CAD software is defined by the functions performed by the software, and not by the type of data (two-dimensional or three-dimensional), the number of dimensions, the type of drawing (polygon, line, etc.), or the type of output device. An example of a CAD application is AutoCAD Activation Code, which is used for designing everything from cars to airplanes. It is part of a family of programs offered by Autodesk.
