Although benign, these tumors have the potential to produce significant acute complications, most of which have been attributed to the presence of mural nodules in the larger cysts. An optimal treatment regimen has not yet been established. Although conservative surgical management, when feasible, has been suggested, these cases are usually benign and are associated with a good prognosis. Radical surgical excision of benign or malignant mural nodules, however, can be associated with significant morbidity. We discuss the current literature on this relatively uncommon entity and highlight the diagnosis, treatment, and management issues of biliary cystadenoma.Intercalation of cefodizime in agar, film, and solution: preparation of information for use in aqueous diffusion. Cefodizime is a new cephalosporin with antibacterial activity against aerobic and anaerobic gram-positive and gram-negative aerobic bacteria, including Pseudomonas aeruginosa, Enterobacter and Salmonella species, Haemophilus influenzae, Streptococcus pneumoniae, and Streptococcus pyogenes. The purpose of this study was to prepare data that is useful in the aqueous diffusion of cefodizime. The hydroxyethylcellulose-epichlorohydrin intercalated agar and film systems were used to prepare such a diffusion system. The newly prepared system was compared with the commercially available diffusion system (Bacto-Cepro-Eusol-S). Cefodizime was encapsulated in gelatine and hydroxyethylcellulose-epichlorohydrin intercalated agar or film. Susceptibility tests were carried out using the overlay and gel diffusion methods. The results obtained with the newly prepared diffusion system were similar to the results obtained with the commercially available diffusion system. The newly prepared system was found to be an alternative medium for the diffusion of cefodizime in aqueous solutions, and diffusion in the newly prepared system
