Implementing a novel operating room pathway for adolescents undergoing limb lengthening and deformity correction: limitations of dedicated pediatric services. Limitations of dedicated pediatric surgical services in the United States include strict funding, limited training opportunities, and patient-family difficulties in travel. The purpose of this study was to determine the feasibility of transferring adolescents to an adult surgical center for limb lengthening and deformity correction when they were medically ready for their procedure. The study was conducted as a retrospective review of all patients who had limb lengthening with or without deformity correction at our institution. Eighteen patients were included in the study. Ten patients underwent lengthening of the femur, seven patients had lengthening of the humerus, and one patient underwent lengthening of both the femur and humerus. All of these patients were from nonmetropolitan areas. One patient underwent a femoral grafting procedure of the femur. Most patients had a preoperative delay of more than 7 days and two patients underwent a preoperative delay of greater than 30 days. Postoperative delay was noted in nine patients, usually due to concern about recurrence of the deformity. The median percentage increase in length for the humerus was 75.3% and for the femur was 47.5%. The mean percentage increase in length was 78.5% for the humerus and 46.8% for the femur. This study demonstrates the feasibility of transferring adolescents to an
