They hacked into the Pentagon and planted some "special" software there. They will ride on anything to be the "badguy" of the day. If there is no "badguy" the Japanese will become one. The role of cytokines in the pathogenesis of autoimmune diseases. Autoimmune diseases, such as systemic lupus erythematosus (SLE) and autoimmune thyroid diseases, frequently have a relapsing or chronic course and response to therapy is often poor. Cytokines are a class of secreted proteins that mediate communication between cells of the immune system. They are essential in the regulation of host defense, tissue repair, and immunological tolerance. The immune dysfunction of chronic autoimmune diseases such as SLE and thyroiditis is due to the defective production of cytokines and production of autoantibodies. Autoantibodies and cytokines can act together. A common pro-inflammatory response and the appearance of myeloid-derived suppressor cells are two hallmarks of these disorders. Anticytokine therapies are currently being evaluated in diseases like rheumatoid arthritis and SLE. Agents such as recombinant human interferon-alpha (rIFN-alpha), IL-1 receptor antagonist (IL-1RA), and anti-IL-6R monoclonal antibodies (mAbs) (e.g., tocilizumab) have demonstrated significant clinical efficacy in SLE and rheumatoid arthritis. Administration of IL-1RA and tocilizumab has been approved by the FDA to treat RA and SLE. With advances in the understanding of cytokine biology and newer biologics, these molecules should have a more prominent role in the future of treating patients with autoimmune diseases. The effect of spruce, pine, alder and birch on the establishment and persistence of a late-successional plant community. The effect of four litter species on the establishment and persistence of a late-successional plant community was investigated in mesocosms
