It is possible to apply recursion when processing the source folder, ask the tool to show the destination directory on task completion and exit, preserve the file modification time attribute for the new items, as well as move the files into the destination folder instead of creating new ones. As far as tag options are concerned, you can use preset file naming patterns and insert new ones. Evaluation and conclusion The tool does not put a strain on computer performance, since it runs on low CPU and RAM. It has a good response time and worked smoothly during our tests, without triggering Windows to hang, crash or pop up error messages. A planar semiconductor chip such as a silicon chip is bonded to a module substrate such as a hybrid IC, a discrete wiring substrate or a TAB tape by using a semiconductor bonding technique. The bonding between the semiconductor chip and the module substrate is performed by using as a bonding material an anisotropic conductive material containing fine conductive particles dispersed in an insulating resin. The anisotropic conductive material is an adhesive in which conductive particles and an insulating resin are mixed and coated on a bonding surface of one of the substrates and the adhesive is then compressed under heating and pressure, and is used for the bonding of electronic parts such as semiconductor chips and for soldering members to each other. To bond the semiconductor chip to the module substrate, the anisotropic conductive material is used in such a way that the conductive particles are interposed between the bonding surface of the module substrate and the bonding surface of the semiconductor chip, and the semiconductor chip and the module substrate are bonded with each other by pressing the semiconductor chip to the b7e8df5c8
