We explain how humans from prehistorical times onward were faced with the problem of handling the memories and experiences of an immense number of ancestors and how their ancestral memories were processed and articulated in narrative narratives. We show how ancestral narratives are organized into coherent wholes and how the process of such production is biased toward a particular number of ancestors and a smaller set of ancestors, including very few in the family line, that is, the parents of the narrators. We give examples of how the practice of ritual productions of ancestors, in the form of genealogies and funeral ceremonies, provides the conceptual and intellectual tool with which to deal with ancestors and present them as part of an ongoing social and existential process.
