Cape Pack Advance uses the same labeling system that you have come to expect from Adobe. The new format will become the first Adobe extension program to use the XML (Extensible Markup Language) format as its code. XML is an open standard, which means that it is not Adobe's product, but it is increasingly the standard in which applications store and exchange content. XML means that information can be compiled as a tree of nodes without losing any details, which enables it to be processed by general purpose languages. This capability brings about a revolution in how data can be used and exchanged. The new metadata bar will replace the old design tool, formerly found in the Font Manager, for editing artwork, fonts, and other graphic objects. It also provides a

way for you to name large areas of the document using tags, and to pick up the tags as you move through the document so that you can easily find the areas you want to work on. Version 10.2 adds XML editing, in addition to support for Adobe Illustrator export and the inclusion of the XML and CSS (Cascading Style Sheets) formats. This opens the door for many new capabilities including Adobe Muse integration, pixel-level editing, and automated image rendering.
