To create architectural designs, architects use a combination of drawings, annotation, and annotation review. In the process of designing the architectural structures, architects need to consider several important issues, including: The type of architectural structures The typologies of the structures The desired appearances The spaces and layouts of the structures The textures and colors of the architectural structures The way the design is articulated The materials and elements used in the designs The role of the drawing and annotation in the design process The security and protection of the designs The type of architectural structures Architects use the terms "building" and "structure" to refer to the physical building components (i.e., walls, windows, doors, roofs, etc.), as well as the interior spaces (i.e., apartments, offices, lobbies, etc.). Structures may be used to build another structure, such as a superstructure on top of another structure, or they may be used to assemble two or more separate structures. Thus, the term "structure" is not limited to the physical building components but includes the interiors as well. For example, the following image shows a structure consisting of an existing building and a new building that is attached to the existing building: The types of architectural structures Architects design and specify the various types of architectural structures, depending on several factors. The types of architectural structures include the following: Single-family dwelling Multifamily dwelling Industrial structures Stadium Large retail store Nonresidential structures Government/public facility Specialty store Transportation/accessory building The desired appearances Architects design and specify the appearance of the architectural structures based on the types of architectural structures. Architects use the term "appearance" to refer to the external look and feel of the architectural structure. For example, the following images show several variations of the appearance of the single-family dwelling: The spaces and layouts of the structures Architects design and specify the layout of the interior spaces of the architectural structures, based on the types of the architectural structures. In particular, architects need to consider the following: The rooms or spaces of the architectural structures The layout of the rooms or spaces of the architectural structures The types of the rooms or spaces of

Animation AutoCAD supports the exporting of 3D models to several animation software packages including Rhythm, Molecule, Maya, 3DS Max, FLIP, Blender, etc. Animation includes the creation of animations for clients, demos, live presentations and training. AutoCAD animators utilize industry-standard tools such as, keyframing, motion tracking, collision, and morphs to design and animate animations. The company also provides a 2D (2D) to 3D (3D) conversion service for animation and video. Limitations AutoCAD has long had a complex user interface. For many years, the normal human-computer interaction with AutoCAD could be described as "going like an engine." This is the experience most users have, and it is sometimes referred to as a "punch and step" interface. This interface consists of a 2D CAD display with a selection handle that allows the user to select the next object to manipulate. A 3D representation of the selected object is then displayed and the user can manipulate the object using a variety of tools. This approach works well for small number of objects, but becomes unwieldy when the number of objects exceeds several hundred. In particular, this approach does not support direct manipulation of very large objects. One of the major problems with the "punch and step" interface is that it is not immediately obvious what the result of any operation will be. This makes it difficult for new users to get familiar with the application and learn how to use it properly. In response to this, the latest versions of AutoCAD (2011 and later) have adopted a new "slider" interface. It is still possible to select and manipulate a single object at a time, but the behavior of the application is clearly explained through large, semi-transparent "sliders" that are displayed on the top of the 3D view. The system also implements a "slide action" functionality, which occurs when the user touches and drags the mouse over the "slider". The objects being selected are shown as little rectangles with fill colors. Clicking on one of the rectangles on the slider causes the "slide action" to be performed, which then shows the newly selected objects in the 3D view. Markup Import and Markup Assist from PowerReviews How can I import feedback from PowerReviews? This utility enables you to import feedback from PowerReviews. When you send a request for a quote to a PowerReviews customer service representative, they provide you with a link to their website, where they have a "customer review request" tool. This tool generates a PDF file with feedback that you can import directly into your project. If you are an AutoCAD user, you can also use our Print Utility to import and incorporate those same reviews into your projects. Contact your PowerReviews representative to get started. Note: The second slide shows the PowerReviews pdf that is generated by the "customer review request" tool on PowerReviews.com. Custom Drafting Views in AutoCAD: Numerous improvements to drafting views. Autocad has traditional drawing views: 2D Drafting, 3D Drafting, and Shaded Drawing. There are additional views available to you, called Custom Drafting Views. Use the new Custom Drafting Views to customize the information you see on the screen, the information you receive from other tools, and even how your drawing gets rendered. When you are viewing a 2D drawing, the different drafting views provide the following information: Canvas View: Canvas view gives you a clear overview of your drawing. Objects and annotations are automatically layered, and text labels are automatically highlighted. Drafting View: With a drafting view, you can choose what information you want to see. It is now possible to view drawings either with annotations (including annotation layers) or without. Drawing View: Drawing view displays the objects in your drawing. You can interact with the annotations and place them in the drawing at a specific position, choose to show/hide annotations, and apply hidden objects to a specific layer. Notes View: Notes view displays the notes that have been associated with the drawing. It's possible to annotate notes and even add new ones. Plan View: Plan view displays the information needed to construct the drawing, including object snap positions and edge and face options. With the new Custom Drafting Views, you can customize all four of the drafting views as follows: Number of objects in the drawing is displayed in the lower right corner of each Custom Drafting View. You can enter the number of objects that are displayed
