Twenty-three patients from the Brazilian Amazon Region, imported from China, were hospitalized in a few days after the beginning of the trip. Anamnesis, clinical manifestations, the influence of previous events

and the methods of investigation that were used are discussed. The most frequently observed symptom was fever, which was accompanied by a wide range of other symptoms. There was no difference between cases of cholera and those caused by a noncholeraic strain of *Vibrio parahaemolyticus*; most patients were treated with tetracyclines, which were effective in most cases. The most important result of this study is the high prevalence of the noncholeraic strain of *V. parahaemolyticus* among patients who were hospitalized with severe symptoms.
