AutoCAD Crack (LifeTime) Activation Code [April-2022]

In addition to the drafting, design, and presentation of architecture, mechanical, civil, and electrical engineering projects, AutoCAD and other CAD systems are used in a wide range of other applications such as: automobile and truck body and chassis manufacturing production management and inventory control fashion and footwear manufacturing building and architectural design aeronautics and aircraft manufacturing scaffolding and demolition of construction mining and minerals processing construction management construction and engineering planning land surveying earthmoving and civil engineering and pipeline construction and maintenance public works land development Real-time 3D modeling AutoCAD 2017 has several new features and performance enhancements. AutoCAD 2017 has also been fully updated with many new features and technology improvements, and compatibility with Microsoft Windows 10. System requirements AutoCAD is an intensively used CAD program and as such it requires a good amount of system resources. These resources include computer hardware and operating system software. The system requirements for AutoCAD depend on the specific platform for which you are planning to use it, the rendering and modeling features you want to use, and the hardware and software platform that you intend to use it with. Requirements for creating and editing objects Create objects You must be connected to a network to create objects. Network connection requirements for creating objects vary based on the network type, the geographic location of the server, and the type of object being created. If you use a network connected to a server that is close to your computer, the performance of the network connection between your computer and the server will determine how fast you can create objects. For more information about network types and connection requirements for creating objects, see Network connections (top of this page). Manage objects You can manage objects without being connected to a network. You can also manage objects only if you have administrator access. Requirements for rendering objects Rendering AutoCAD supports the following rendering formats: AutoCAD supported rendering formats are dependent on what the platform that you are using. AutoCAD rendering requirements vary depending on what platform you are using it on. Rendering is more intensive on desktop than mobile. AutoCAD rendering formats vary between platforms. Requirements for modeling objects Modeling Modeling depends on the specific

Protected and non-protected area In two-dimensional (2D) drafting, protected area may be used to designate a portion of the drawing. It may be defined either by graphics information or by technical information, called the technical area. The graphics information is defined by object(s), called object(s) without a graphical representation. This information can be generated by a vector drawing program, or be an imported drawing, which is stored in the data model. The object is indicated by a text string (and perhaps other text information such as a comment). This text string can be part of a graphics file, or part of a technical drawing file. The technical information can be either graphical or non-graphical. Non-graphical technical information can be stored in any way, e.g. numeric, text, binary, etc. The graphical and non-graphical information of each part of the drawing is saved in an area. The protected area should not be modified by the drafter. The non-protected area can be modified in accordance with the needs of the drafter. Usage of the protected and non-protected area is defined by the operating system in which the AutoCAD program runs. The protected and non-protected area may have a different use depending on the operating system. For protected and non-protected areas, the drafter may mark the protection with text, shading or graphics. In addition to the protected and non-protected area, there are non-protected areas: areas that can be changed at the discretion of the drafter, such as the comments and title blocks. Using AutoCAD's protected and non-protected areas, you can assign an additional set of information to each part of the drawing. This can give a new look to the drawing, or to part of the drawing. This can be done using graphics and text. History AutoCAD is descended from several older software products, mostly Cadsoft DWG and MasterCAD, an in-house product from Autodesk. In the early 1990s, Cadsoft DWG was further developed under the name CadQuery to create a batch processing tool. In the mid 1990s, CadQuery was re-branded as CadQuery Pro as part of Autodesk's decision to re-focus on software development. The name CadQuery Pro was also used to refer to the DWG-based software that replaced it. In the late 1990 af5dca3d97

What's New In?

Markup imported text and comments with highlighted changes can be easily read by AutoCAD. Workflow Improvements: A new high-performance, scalable network optimizer with 10x faster network speeds for CAD sessions. With the introduction of the C2D Network Optimizer, AutoCAD and C2D can run over the same LAN or the internet. The Optimizer can also optimize AutoCAD, C2D and ACE, over a network, for session and/or server-based applications, or from the command line. You can manage the optimizer settings and download updates through the C2D Admin Center. More security and user rights management: Enhanced user rights management (URM) and additional user rights can be used to control access to the system. URM enables you to grant and revoke specific permissions for individual users, or groups, to access the system. In addition, URM offers more options for managing user rights. You can view all of the users in the system, change user rights and associate them with a particular role or identity. Automation and integration: New features in the Personal Workflow and New User Interface (NUI) to automate your workflow. PW may be defined as any object that can be created, manipulated, and manipulated automatically, without user intervention. You can use PW for managing and automating jobs, such as adding DWG elements to a model. PW features can also be used to automate common tasks. They can include creating components, converting DWG to PDF, or exporting to Postscript. NUI for the Share Menu: With the new interface, you can choose to send or transfer drawings via email, cloud storage, network or import existing DWG. The NUI allows you to manage your drawing collection, use your contacts and Share menu to post drawings to social media, and track the sharing activity of your drawings. New Share functionality: The Share feature offers you the ability to send or transfer drawings via email, cloud storage, network or import existing DWG. Use the Share menu to upload drawings to the cloud and send your drawings via email or send to a specified recipient. You can also send drawings from the Send to menu. New AutoDoc feature: Autom
