To assess the efficacy and safety of a self-expandable stent (SES) for the treatment of anastomotic strictures after esophagectomy, and to evaluate the factors associated with delayed patency. Patients who underwent esophagectomy and reconstruction with a SES between January 2011 and June 2015 were included. Twenty-six patients (16 men and 10 women; mean age, 64.3 years) were included. Strictures developed in all patients within 6 months after surgery. The average stricture length was 5.8 ± 2.9 cm, and the average length of the stent was 6.2 ± 2.6 cm. The average duration until stent removal was 6.5 ± 3.7 months. All strictures were successfully treated. Six patients (23.1%) required additional dilatation, and the patency rate was 84.6% (11 of 13 patients) at 2 years. Strictures were developed in all patients within 6 months after surgery. All strictures were successfully treated with the SES. 15-year-old Jaden Smith is the latest artist to issue a free MP3 of himself singing a song.
