Field of the Invention The present invention relates to a method of fabricating an organic transistor and to a method of fabricating an organic light emitting device. 2. Description of the Related Art An organic transistor is a thin film transistor having a three-dimensional structure in which a channel, a gate, and a source and a drain are arranged on an organic semiconductor layer. Organic transistors have been proposed, for example, in U.S. Pat. No. 6,703,356 (Patent Document 1) and U.S. Pat. No. 6,723,746 (Patent Document 2). The Patent Documents 1 and 2 propose a method of fabricating an organic transistor using micro-contact printing (μ -CP). Specifically, a solution containing an electrode material, which is a polymer, is prepared and applied to the surface of a substrate. The substrate is then heated in a vacuum chamber so that the polymer is transferred to the substrate by evaporation. Time-lapse microscopy: a powerful tool for investigating changes in cell behaviour in response to stress. In the past five years, time-lapse microscopy, which is an essential tool in the analysis of cell movement and the dissection of cell shape and size variations, has also been used to study cell behaviour under conditions of stress. In particular, this powerful technique was successfully used to analyse the behaviour of various cell types under conditions of osmotic stress (glucose-free medium), starvation, heat shock and hyperosmotic shocks. In addition, the importance of understanding the type of cell death induced by stress has become increasingly important. As an example of this, we show that

The following list of operating systems is available.Prognostic factors in early gastric carcinoma: long-term results after curative D2 gastrectomy. Survival rate in Stage I gastric carcinoma (GC) in Japan has remained similar to that seen in Western countries over the last 10 years. The 5-year survival rates for intramucosal (0-IIa) and minute (0-IIc) cancers after curative resection have increased to 80 and 82%, respectively. The present study is a prospective evaluation of prognostic factors in gastric carcinoma. Patients with clinical Stage I and II GC who underwent curative resection (D2) between June 1976 and July 1988 were reviewed. There were 613 patients with 685 cancers, including 366 (55.7%) minute (0-IIc) and 319 (49.4%) intramucosal cancers (0-IIa). The median follow-up period for surviving patients was 102.5 months (range, 22-180 months). The 5-year survival rates were 89.7, 70.6, and 47.4% for 0-IIa, 0-IIc, and > or =II cancers, respectively. Tumor size and depth of tumor were the most powerful independent prognostic factors. The 5-year survival rates in T1-3 and T4 cancers were 84.8 and 47.5%, respectively (P = 0.0001), and in mucosal and submucosal (Tsm) cancers were 91.5 and 6d1f23a050
