Thanks In Advance :) A: I'm guessing (based on that, but based on other ways it's done) you have:
my_library = pd.read_csv(file, encoding="utf-8", decimal=",") That will give you a dataframe of all the lines and each line will have a column called 'line_id'. That column is not associated with a line in the file. It just marks where each line starts. In a multi-line file, the lines are just a row. So, if you want to count the number of lines in a file, just find the number of rows in the dataframe: num_lines = len(my_library.row) If the number of lines is greater than the number of rows, there's an extra row at the end for the last line of the file. So, now you can write out a new file with just the last line if you want. In the new file: for row_number in range(0,len(my_library.row)): if my_library.line_id == 0: print("I'm the first line of a new file") else: print(my_library.line_id) A complete minimal example: In [74]: my_library = pd.read_csv(file, encoding="utf-8", decimal=",") In [75]: num_lines = len(my_library.row) In [76]: if num_lines > 1:: print("There's an extra row at the end of this file"): else:: print("There's only 1 row in the dataframe"): for row_number in range(0,len(my_library.row)):: print("I'm the first line of a new file"): if my_library.line_id == 0:: c6a93da74d
