## Top Rated Kaori Kirara Fuzz Vol 65

VIDEOS A: I am going to make a few assumptions about what you are doing. You want to create a script which scrapes a page for all the links in a given block, and for each link, gather the URL and the page's title. You then want to loop through all of those links and download each one's page, storing it with the URL and the page's title. You will then create another script that downloads the page's content. I did this before, so I can take it from here. Given that you are trying to do this in one script, and your stated problems, this is the ideal way. One script will do all of your downloading and parsing, storing the links in a database for your other scripts to use. The one and only disadvantage to this, is that you won't be able to do this for all pages at once. The next best method, for you, would be to do it manually for the first couple pages, and build a system to sort and download the rest, using what you have already. Assuming your app is written in PHP, and you are using cURL to fetch the pages, here is what I used to do it all in one script.

```
$start = 1; $max = 6; $url =  
urldecode(""); // Set curl parameters $ch =  
curl_init(); curl_setopt($ch, CURLOPT_URL, $url);
```

---

```
curl_setopt($ch, CURLOPT_HEADER, 0);
curl_setopt($ch, CURLOPT_RETURNTRANSFER,
1); $i = 0; while($i ''); $link = substr($page,
strpos($page, ""); $link = str_replace('>', "",
$link); $db_array[] = array( 'link' => $link,
'page' => c6a93da74d
```
