
B3410 Flash Loader 7 0 4 SGH 05 V1 5 For Product

it is possible to use the j-link for production debugging as well as development. the tools are available to enable you to do so, the software is free and open source. in particular, j-flash allows unlimited access to arbitrary flash memory, while being able to carry out a variety of checks. the j-link also has the option of further software enhancements with the production flash programming utility (j-flash). the ability to take full advantage of the development environment using the unlimited flash breakpoint module also means you free your development from the hardware breakpoint restriction. in this test, j-link is the clear winner.

in conclusion, speed comparison shows that seggers j-link is the fastest debug probe available. if considering a device that hasnt been mentioned in these tests, make sure to ask your supplier for their flash programming numbers. were pretty sure segger will outperform all the others. with options that suit every debugging and production need, segger has you covered! production grade programming tools typically feature a more sophisticated, multi-step verification process. many applications also require customization / patching of variable data such as serial number(s), mac addresses and similar. any qualified engineer can write a flash loader for j-link and risc-v, usually within a day or two. segger also offers the service of writing flash loaders for particular devices where desired. proven flash loaders can be added to the j-link software, so that they will simply work out of the box. any qualified engineer can write a flash loader for j-link and risc-v, usually within a day or two. segger also offers the service of writing flash loaders for particular devices where desired. proven flash loaders can be added to the j-link software, so that they will simply work out of the box.

j-link supports
byte- or page-
programming of
all flash types. it
can handle
physical
addresses (a in
hex or u in
decimal system)
and logical
addresses:
physical/logical,

unmapped/mapped, multi-page programming. for qspi flash, in which both the start address and the length are stored in the flash itself, j-link takes care of erasing the complete device, starting at the start address and

programming
the complete
device in one
operation. the
length of flash is
taken into
account. j-link
supports full
flash memory
access for host
devices, and
generic access to
nor flash.
through the bus
bridging and

memory
mapping, j-link is
fast enough to
program
significant
amounts of data
into the device.
the application
project illustrates
the flexibility of
the flashloader
and shows how
an example
solution can be
easily

integrated. it
guides
developers on
how to review,
configure and
customize the
major software
components, and
update the
example to fit
nearly any
requirement.
need more
information on
how to set up

the debugger / j-link commander into parallel (cfi) nor flash memory then please refer to the j-link downloads page and check out the flash download chapter. for production environments, we recommend

using j-flash or
flasher arm
standalone. the
installation of
smartrf flash
programmer
must be
executed with
administrator
privileges to
allow usb driver
installation. a
user access
control dialog
will appear when

starting the installer. if the user has administrator privileges, click on the yes button to continue installation. if the user does not have administrator privileges, a user id and password with these

privileges must
be entered to
continue.
