DBeaver is a comprehensive and effective software solution geared towards developers and database administrators who need to manage and organize tables, triggers, views and stored procedures from multiple databases. Irrespective of the database you choose to work with, here referring to MySQL, SQLite, PostgreSQL, Oracle, Microsoft SQL Server, IBM DB2 and Firebird, the application comes in handy for users who need to handle multiple connections, thus organizing and editing various database objects including indexes, user accounts and scripts. An intuitive and user-friendly interface Once you launch the application for the first time, it will automatically scan the entire computer and display the existing connections (if they are available). In case you want to create a new connection, simply access the proper option, choose the database you are interested in, then set the login credentials (optionally, specify the ODBC drivers if they are required). After that, DBeaver displays all of the identified databases and users for the current connection. A new tab, entitled Projects, will become available in the left panel of the program from where you can easily access the database object you want and view its data. For instance, if you double click on a specific table, the right panel will display all the necessary information such as available columns, pre-defined constraints and foreign keys, references, triggers, indexes and the proper CREATE DDL statement (also known as Data definition language). Practical SQL editor and query execution commands Considering the main purpose for which it was designed for, DBeaver comes with a reliable SQL editor that allows you to quickly edit and execute queries and scripts. Additionally, you are able to load an existing SQL script, as well as validate or simply analyze the selected query. As far as the query execution command is concerned, you can run the selected SQL query using the proper options available in the toolbar or pressing the 'CTRL+Enter' key combination. A straightforward database solution All in all, DBeaver comes packed with useful and easy to handle tools and editors that come in handy for users who need to manage multiple database connections, triggers, procedures and views, as well as execute SQL scripts, from simple to complex. The KeyMacro component provides an abstraction layer for the UNIX file system. It allows applications to access files on remote UNIX systems using a standard FUSE interface, from a traditional file system. The KEYMACRO interface is similar to that used by NFS, but presents only a few of the features of a native NFS filesystem. Dependencies: Recommended Settings: Additional Notes: In Linux systems, KeyMacro may require kernel patches to support hot-plugging devices. For Windows users, please note that KEYMACRO relies on a proprietary Microsoft extension which may not be available in future versions of Windows. For more information, see our FAQ. Required: Requires PKGBUILD for installation of the software, which is a prerequisite of KeyMacro itself. Optional: Recommendations: For Linux systems: KeyMacro is fully supported by FUSE. If you are going to use the FUSE file-system library, it is recommended to use at least version 2.7.9. If you are using fuse-2.9.1 or later, KeyMacro should work properly. However, KeyMacro has known issues when using fuse-2.9.2 or 2.9.3. On Fedora, add KeyMacro to your GNOME Menu: Open a terminal (Ctrl+Alt+T) and run the command: \$ sudo dnf install gtk2-devel on other distributions, you can find other GNOME dependencies: \$ sudo apt-get install libglib2.0-dev \$ sudo apt-get install libgtk2.0-dev \$ sudo apt-get install libatk1.0-dev \$ sudo apt-get install libc6-dev \$ sudo apt-get install libx11-dev \$ sudo apt-get install libxmu-dev \$ sudo apt-get install libxt-dev On Windows systems, you can install it using the keymacro installer. The installer will be the KeyMacro installation itself; you do not need to run it. You can close it once it is done. Install: \$ keymacro-install.exe After installation, KeyMacro should be installed in the directory: C:\Program Files\Key 2edc1e01e8
