The impairment of cellular immune function, particularly that of T lymphocytes, is a hallmark of chronic infection, autoimmunity, and tumorigenesis. This is thought to result from autoimmune injury and the persistent and constitutive generation of free radicals. Since free radical damage to molecules is irreversible, the capability of immune function and T-cell-mediated immunity to natural death in response to antigenic challenge is reduced or lost in infected or tumor-bearing individuals. T-cell immunity to tumor cells may also be diminished by this mechanism. Attempts to prevent free radical damage to lymphocytes have included both dietary antioxidants and drugs that limit oxidation of cellular constituents. Not only is it unknown whether prevention of oxidative damage to immune cells can actually enhance T-cell immunity, it is not known whether immune responses to pathogens can be modulated by this mechanism. Since T lymphocytes are intimately associated with other cells such as macrophages in vivo, we propose that oxidized macromolecules such as lipoproteins that are generated during macrophage activation also alter T-cell responses. Thus, interactions between cells of the immune system or between macrophages and T cells may themselves be profoundly altered by oxidant stress. To test this hypothesis, we first compared the relative susceptibility of free and immobilized T cells to free radical damage. We found that free T cells were significantly more sensitive to oxidative stress than immobilized T cells. As an extension of this work, we tested the hypothesis that T cells in vivo are also more sensitive to free radical damage when not anchored to other cells, and that production of lipid peroxidation products by macrophages can alter T-cell responses. Immunization and challenge of mice with T cells that had been exposed to either lipopolysaccharide or to a major histocompatibility complex-restricted antigen failed to elicit a major immune response. These results suggest that lipids generated during macrophage activation may serve as a modulator of immune function and potentially play a role in human conditions such as acquired immune deficiency syndrome. 79a2804d6b
