The MMS format is also referred to as Multimedia Message Service (MMS) and is a standard used to send multimedia messages between devices. Multimedia content includes text messages, graphics, animations, and sounds. The advantage of using MMS instead of SMS is that messages sent through MMS stay in your phone longer and can also be viewed on multiple devices even if they are not equipped with MMS. This is because the MMS messages are sent in a zip file format. An MMS messaging service is a

telephony service provided by a telecom operator or internet service provider. The user receives multimedia messages sent from other MMS users. MMS may be sent via the Short Message Service (SMS) but is more commonly sent via the MMS service. MMS messages typically cost more than SMS messages. Sometimes it may be cheaper to send an MMS message than to send an SMS message. MMS messages can contain multimedia such as images, video clips, audio files, animations, and other more advanced data which can be shown on a phone or other multimedia device. 2edc1e01e8
