### **What's New in the Simple TCP Proxy Datapipe (formerly Simple TCP Proxy Pipe)?**

Simple TCP proxy/datapipe is a simple TCP proxy server. It is based on the POCproxy library, which in turn is based on libevent. It can be used to

connect a set of TCP clients to a single host/port and enables SSL tunneling between these clients and the server. It supports multiple targets and incoming connections. It is a simple and free utility for those who need a TCP proxy server. In the current version, only the local port is available. Simple TCP proxy/datapipe (formerly Simple TCP Proxy/Pipe) was developed by Jam Software as open source project. You can download Simple TCP proxy/datapipe source code directly from

GitHub or you can browse their bug tracker to report issues with this software. Extension module for Tinyproxy to handle requests coming from Windows, Mac and Linux clients. The following methods are available:

`is_local_ip`, `local_ip`,  
`current_remote_ip`,  
`current_target_ip`, `server_ip`,  
`local_port` and `server_port`. A module is executed for each client one by one. This is a completely free example of a Bash one-liner script that will find all computers with 2 active

NICs in your local network (only if the MAC address of the NICs don't match) and "Ping" them, making you aware if there are any problems between them.

This is a simple PHP script that will help you to read network activity statistics from all computers in your local network.

The software will scan all network interfaces and find out all computers, which are online, which are on a specific IP address and which are on a specific port. Linux Backup Master is a powerful simple

backup system. It has many built-in features, and is very flexible and easy to set up. It supports off-site back-ups, restores and databases, incremental backups, backup quotas, snapshots, full backups, auto-detection and scheduling. It can backup from local, remote and iSCSI storage devices. The backup files are encrypted, and can be automatically sent to multiple destinations, including FTP, SFTP, SSH, HTTP, HTTPS and other protocols. Linux Backup Master uses rdiff-

backup, and also supports incremental backups, full backups, snapshots, restore points and full databases. Ever used a remote script that you wanted to modify or run in other context? This tool will help you a lot by making available the executable of the remote script on your local machine. To use it, you simply have to specify the location of the script, the name of the remote executable and the parameters. You will then be able to run the script in your current context. Differential

backup is a backup system that takes multiple snapshots to create a backup or differential file. These snapshots are then applied to a single directory using the GNU 'diff' command. This script works on both Linux

**System Requirements For Simple TCP Proxy Datapipe (formerly Simple TCP Proxy Pipe):**

Windows: Windows 7, Windows 8.1, Windows 10  
Windows 7, Windows 8.1, Windows 10  
Processor: Intel Core i5-4590 or AMD equivalent  
Intel Core i5-4590 or AMD equivalent  
Memory: 4GB RAM  
4GB RAM  
Graphics: NVIDIA GeForce GTX660,  
AMD Radeon R9 270X or equivalent  
NVIDIA GeForce GTX660,  
AMD Radeon R9 270X or equivalent  
HDD: 60GB HD space  
60GB HD space  
Free space: 25GB  
25GB  
Sound: 3.5M
