Adobe has completely redesigned the photoshop editing software and is basically optimizing it for today's Mac, Windows, and Linux users. If you were planning on purchasing Lightroom you should probably just wait for the next generation of Lightroom, which is coming up. Better yet, if Lightroom is something you have in your arsenal, just use it to organize your photos and then use Photoshop for your final edit. I've been testing OS X 10.7 Beta, and it's extremely stable. Adobe could not have prepared it faster. It has a decent set of tools, including the new Content-Aware tools. For people who use Photoshop less often but still need to know how to use the tools, this is a good way to start. For example, you can take part of your image out of a photograph. I'm sure many of you know what a clone stamp is. You know how to use it to duplicate an area? It can also be used to extract an area of your image and save it as a new file. I've summarised the various new commands in the screenshot below. I'm not totally satisfied with the way it works (in CS6). One of the greatest weaknesses is the way I lose my place and have to redo my project. It happens when I'm not thinking very clearly and want to change something. I would like to have a smoother, more usable approach. The editing process is more the problem than the layer editing and selection tools.

I'm happy that Lightroom 5 is very stable and works very well. I want to have more focus. Lightroom can be an amazing toolbox. It can be a great way to organize your photos, but even more importantly, it allows you to manage a wide number of photos at the same time. It's just right for picture archiving and retrieval.
