I just upgraded to the LR5.2 RC yesterday. I hope it will be the true 4.3 version, but it will take a little longer release plan that 5.0.0 since it is under NDA. Now in 5.0, there are some menu/spotbug/finder/etc issues that will be patched for the public release next quarter. The main UI is more fully integrated as expected. UPDATE: OK, so I tested the Slideshow Tool as described in my introduction. It's an interesting new tool, but many of the menu options don't have icons. Sometimes the menu options are not even available. I used 6 JPG slides, 2000x1000 in size at a 30 fps, at a screen resolution of 1920x1200 in my 120 RGB monitor for testing. I want to be clear, this is still Beta software, so I'm NOT using it as my Day-to-Day tool. Please don't misinterpret my statements. The tool should be powerful and easy to use. However, I need to add more testing on how it will behave when working at different resolutions, project sizes, and number of participants in the screen view. I would also like to be able to test whether it will generate a preview of any length...a lot of this seems to be up to the user. I've been a fan of Apple's Photo Display app ever since the first time I used it. It works in a very simple way to show you visual slides in a slideshow that's easily shared. Lately, I've been looking for something that I can use to emulate that type of display in the desktop version of Photoshop. Until now, those options have been limited to showing you a graphical thumbnail in a slideshow with quite a few options to configure, but none of them could really disguise the source of the images. Enter, Photofly. Version 5.3 is still primarily a beta but it's absolutely a step in the right direction by offering a much stronger interface than the previous version. The problem, of course, is that it still doesn't offer much in the way of technical options.
